Explain linear models and the meaning of simultaneous-equation solutions.

Key knowledge | Free preview

Learning target: Explain linear models and the meaning of simultaneous-equation solutions.

A linear model combines a starting amount with a constant change per unit of input. The arithmetic formula does not decide its own domain: practical restrictions do. Explain the units of the gradient and intercept, identify when the process changes or stops, and judge predictions only within the range where the assumptions remain reasonable.

Try the mathematics

Task 1. A tank begins with 600 L and drains at 25 L per minute. Form V(t), find the time at which 200 L remains, and state a valid time domain.
