Use technology to find a supporting example or a counterexample to a proposition.

Key skills | Free preview

Learning target: Use technology to find a supporting example or a counterexample to a proposition.

A counterexample disproves a universal claim by showing one valid case in which it fails. Technology can calculate a candidate quickly, but the chosen inputs must satisfy the claim's conditions and the comparison must concern the same operation. Equal results in several examples provide evidence for a conjecture, not a proof that it always holds.

Try the mathematics

Task 1. Test the claim "AB=BA for every two square matrices of the same order". Enter A=[[1,2],[0,1]] and B=[[1,0],[3,1]] in a matrix-capable tool. Calculate both products and check one differing entry by hand.
