General Mathematics | Units 3–4 | Outcome 1

Form and analyse a first-order linear recurrence in a financial setting.

Key skills | Free preview

Learning target: Form and analyse a first-order linear recurrence in a financial setting.

Many financial models share the form u(n+1)=Ru(n)+d, but the meanings of the multiplier, addition and index differ. Interest or reducing-balance depreciation changes R. A repayment, withdrawal or flat loss changes d; regular saving makes d positive. State the timing of any payment and whether a period means a year, month or item of production.

Try the mathematics

Task 1. Starting at 10000, write update rules for: annual simple interest of 3%; annual compound interest of 5%; flat depreciation of 800 yearly; unit-cost depreciation of 2 per item; reducing-balance depreciation of 15% yearly; a monthly loan at 0.5% with end-month payment 250; an annuity at 0.5% with withdrawal 300; and regular saving at 0.5% with deposit 200.
