Understand graph types, adjacency matrices and planar Euler relationships.

Key knowledge | Free preview

Learning target: Understand graph types, adjacency matrices and planar Euler relationships.

A graph records relationships through vertices and edges; the drawing’s apparent distances have no meaning unless weights are supplied. Degree counts incident edge ends, so a loop counts twice. A bridge is an edge whose removal increases the number of connected components. Isomorphic drawings preserve adjacency even when positions and labels change.

Try the mathematics

Task 1. An undirected graph has vertices A,B,C,D,E and edges AB,AC,BC,CD,DE. Draw it, list the degrees, identify bridges and construct its adjacency matrix in order A,B,C,D,E.
