Functions, domains, codomains and ranges

Key skills | Free preview

Learning target: State a function's rule, domain, codomain and range, and decide whether a given relation is a function.

A function gives exactly one output for each allowed input. Its codomain is the declared target set; its range is the set actually reached. State restrictions before evaluating or reversing a rule. A graph or table can be a function even when two different inputs share the same output.

Try the mathematics

Task 1. Let $f:[-1,3]\to R$ have rule $f(x)=x^2+2$. State its domain, codomain and range. Find $f(-1)$, $f(0)$ and $f(3)$, and explain why f has no inverse function on this whole domain.
