Testing claims

Key knowledge | Free preview

Learning target: Understand how examples, counterexamples and general arguments test mathematical claims.

One valid counterexample can refute a universal claim, but several agreeing examples cannot prove a general statement. Use the context to choose meaningful tests, then distinguish numerical evidence from an algebraic justification. State exactly what is established and which modelling assumptions remain. A claim about the model is not automatically a claim about every real situation.

Try the mathematics

Task 1. A student says the object cools by the same number of degrees every four minutes. Use the observations to test the claim and distinguish a constant difference from a constant ratio.

Continue with the full worksheet

The complete resource has 2 focused task sets and substantive worked solutions. Use an exercise book or print the A4 worksheet. This preview shows the first task without its full solution.
