Solving a contextual problem with technology

Key skills | Free preview

Learning target: Use computational thinking, algorithms, models and simulations to solve a contextual problem.

A technology-assisted solution should connect the context, model, computation and interpretation. State the variable and its valid domain before choosing an algorithm. Record enough inputs and settings to reproduce the result, then test it independently. Rounding is a final reporting decision; it should not replace the more accurate internal values needed for verification.

Try the mathematics

Task 1. Use Newton iteration in a calculator, spreadsheet or short program to determine a positive side length for a 7 m^3 cubic tank. State the algorithm inputs and verify the output.

Continue with the full worksheet

The complete resource has 2 focused task sets and substantive worked solutions. Use an exercise book or print the A4 worksheet. This preview shows the first task without its full solution.
