Specific and general formulations

Key knowledge | Free preview

Learning target: Understand how particular cases and general mathematical formulations produce results for an investigation.

A particular example can suggest a pattern, while a general formulation shows which features depend on parameters. Keep the contextual conditions visible when moving to symbols. Derive results from the formula, then check a concrete case. The algebra describes the model exactly; whether it adequately represents the situation must be considered separately.

Try the mathematics

Task 1. A simple random sample of 200 items from a very large production stream contains 64 defects. Investigate a population-defect estimate and approximate 95% interval using $z=1.96$. A supplier claims the defect proportion is 0.25. Calculate the estimate and interval. Decide whether the supplier’s value is inside the interval.
