Design and implement suitable simulations and algorithms

Key skills | Free preview

Learning target: Design and implement suitable simulations and algorithms.

Use a calculator table, spreadsheet or short program to examine $u_0=100$, $u_{n+1}=0.8u_n+60$. Keep a record of inputs, iteration order and displayed precision. The closed form $300-200(0.8)^n$ gives an independent benchmark. Expected outputs below are mathematical checks for your run, not a claim that software has already run.

Try the mathematics

Task 1. Implement a stochastic comparison: each week retain each current member independently with probability 0.8, then add 60. Start with 100; run four weeks and repeat 2000 independent trials. Give pseudocode and the expected mean benchmark.

Continue with the full worksheet

The complete resource has 2 focused task sets and substantive worked solutions. Use an exercise book or print the A4 worksheet. This preview shows the first task without its full solution.
