Learning target: Understand principles of proof and deductive techniques.

Induction establishes a family of statements through a base case and a justified transition. The induction hypothesis concerns an arbitrary index, so it may be used inside an algebraic or matrix calculation. The resulting proof must state its integer domain and cannot be replaced by checking many numerical cases.

Try the mathematics

Task 1. Prove that 5 divides 6^n-1 for every integer $n\geq 1$. Explain why the same reasoning does not claim the expression is divisible by 5 for every real n.
