Formulate and solve the specified types of differential equations

Key skills | Free preview

Learning target: Formulate and solve the specified types of differential equations.

A differential equation constrains rates rather than directly giving a function. Initial conditions select a particular solution from a family. Separation may lose an equilibrium if you divide by a vanishing factor, so check it independently. A numerical method approximates the local slope and needs both a step size and a starting point.

Try the mathematics

Task 1. Solve $y' = xy$ with $y(0) = 2$ and verify the result. Also solve $y'' = 6x$ with $y'(0) = 2, y(0) = 1$.
