Formulate and solve problems involving sample-mean distributions

Learning target: Formulate and solve problems involving sample-mean distributions.

The sample mean varies across repeated samples even when the population is fixed. Independent sampling gives mean μ and standard error σ/√n. A normal population gives exact normal sample means; for other populations, a large-sample approximation needs judgement about skewness, tails and the sampling mechanism.

Try the mathematics

Task 1. A normal population has mean 80 and SD 12. For 36 independent observations, give the exact distribution of the sample mean. Use Φ(1)=0.8413 and Φ(-1)=0.1587 to estimate P(78<$\bar{X}$<82).
